

TIRE PRESSURE MEASUREMENT DEVICE CAPABLE OF AUTOMATICALLY GENERATING ELECTRIC POWER

FIELD OF THE INVENTION

The present invention relates to a tire pressure measurement device capable
5 of automatically generating electric power and, more particularly, to a device,
which can automatically generate electric power and conduct the electric power
out to subassemblies in the tire room when a vehicle's wheel rotates.

BACKGROUND OF THE INVENTION

Generally, as shown in Fig. 1, the working electric power of a tire pressure
10 measurement unit 60 used for measuring the tire pressure of a tested tire
(including abnormal signals such as a too high tire pressure, a too low tire
pressure and an insufficient electric power) is directly provided by the voltage
generated by a power source regulating circuit 65.

An electric current can be generated through the interaction between a
15 permanent magnet disposed in a wheel body of a skateboard, an inline skate or
a roller skate and a coil for inducing a current to let light emitting devices
installed on the wheel body emit light.

Therefore, if a device can be provided to generate automatically electric
power provided to the above tire pressure measurement unit, the problem of an
20 insufficient electric power can be solved.

SUMMARY OF THE INVENTION

One object of the present invention is to provide a device capable of automatically generating electric power and conducting this electric power out for providing working power for subassemblies like a thermometer, a
5 gradienter, and a tire pressure measurement unit in the tire room when a vehicle's wheel rotates.

To achieve the above object, a tire pressure measurement device capable of automatically generating electric power of the present invention comprises a tire pressure measurement unit, a microprocessor control unit and an automatic
10 generating unit. One or more permanent magnets are disposed in the automatic generating unit and annularly arranged on a braking panel. An induction coil is disposed in a corresponding portion of the magnetic permanent. The induction coil is formed by continually winding a conducting wire around an aluminum ring. Each distal end of the induction coil is connected with an electric power
15 lead-out wire. An electric power can thus be generated and conducted to the microprocessor control unit and the tire pressure measurement unit when a vehicle's wheel rotates. The above microprocessor control unit is connected with a thermometer for measuring the temperature of the tire and a gradienter for measuring the balance state of the tire. The thermometer and the gradienter
20 are connected to the electric power lead-out wires of the induction coil.

BRIEF DESCRIPTION OF THE DRAWINGS

The various objects and advantages of the present invention will be more readily understood from the following detailed description when read in conjunction with the appended drawings, in which:

5 Fig. 1 is an architectural diagram of a conventional tire pressure measurement unit;

Fig. 2 is an architectural diagram of the present invention; and

Fig. 3 is a structural diagram of an automatic generating unit of the present invention.

10 DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

As shown in Figs. 2 and 3, a tire pressure measurement device capable of automatically generating electric power of the present invention is a device for measuring a tire pressure value of a tested tire and sending out this tire pressure value in a wireless way. The tire pressure measurement device comprises a
15 microprocessor control unit 1, a wireless transceiver 2, an inflation/deflation control component 3, a tire pressure measurement unit 4 and an automatic generating unit 7.

The tire pressure measurement unit 4 is disposed in a tire room and used for measuring a tire pressure of a tested tire to detect abnormal signals like a too
20 high tire pressure, a too low tire pressure or an insufficient electric power and the tire pressure state.

The microprocessor control unit 1 is connected with a wireless transceiver 2, an inflation/deflation control component 3 and a tire pressure measurement unit 4. The microprocessor control unit 1 processes the signal data measured by the tire pressure measurement unit 4 and sends the signal data via the wireless transceiver 2 in a wireless way or receives signals from the wireless transceiver 2, thereby operating the inflation/deflation control component 3.

The automatic generating unit 7 has one or more permanent magnets 71 annularly arranged on a braking panel 72. An induction coil 73 is disposed a corresponding portion of the permanent magnet 71. The induction coil 73 is formed by continually winding a conducting wire around an aluminum ring 74. Each distal end of the induction coil 73 is connected to an electric power lead-out wire 75. The induction coil 73 can generate an induced electromotive force to provide power for the microprocessor control unit 1 and the tire pressure measurement unit 4 through rotation of the wheel.

Reference is again made to Fig. 2. A gradienter 5 for measuring the balance state of the tire and a thermometer 6 for measuring the temperature of the tire can be provided in the tire room. The gradienter 5 and the thermometer 6 are connected to the electric power lead-out wires 75 of the induction coil 73, and are also connected to the microprocessor control unit 1.

When the wheel rotates, the induction coil 73 generates an induced electromotive force to provide power for the microprocessor control unit 1, the

tire pressure measurement unit 4, the gradienter 5 and the thermometer 6 via the electric power lead-out wires 75.

To sum up, the present invention can generate an electric power when a vehicle's wheel rotates and conducts this electric power to the microprocessor
5 control unit, the tire pressure measurement unit, the thermometer and the gradienter.

Although the present invention has been described with reference to the preferred embodiments thereof, it will be understood that the invention is not limited to the details thereof. Various substitutions and modifications have been
10 suggested in the foregoing description, and others will occur to those of ordinary skill in the art. Therefore, all such substitutions and modifications are intended to be embraced within the scope of the invention as defined in the appended claims.
